Charging and Pairing the VXI BlueParrott B150

1) Charge your headset for a **full 4 hours** before initial use. When using the headset, you will know it is low on power when it begins beeping when you haven’t touched any buttons. After this initial charge time, you will receive approximately 2.5 hours of Talk Time (up to 6 hours total) for each hour you charge your headset.

2) Plug your **TRENDnet device** into a USB port on your laptop.

3) Turn off your headset by pressing the main button until you hear three descending musical notes.

4) Pair it with your **Bluetooth USB device**. Press the main function button until you hear two different melodies – one 3-note melody and one slower, 2-note melody. A red and a yellow light will flash until it is paired, after which the red light will stop flashing. The yellow light will continue to flash approximately every 3 seconds.

5) Right-click your **My Bluetooth Places** icon, then right-click your **BTHS hands-free unit** icon and choose Connect.

   When prompted, enter this **Security Code: 0000** (4 zeros).

6) Press the main button for one second to turn on the **Talk mode** (from Standby).
Getting the Most out of Your Headset

Place the mouthpiece more to the side of your mouth than with a standard headset, to avoid blowing into the very sensitive BlueParrott mic.

Dictate into Dragon pad for several sessions before attempting to dictate into Word or another program.

Conserve Talk Time by pressing the main button once to put the headset into Standby mode. (if you can’t tell the difference, look to see if the yellow light is flashing slowly – every 4-5 seconds in Standby mode and faster – about every 1 second in Talk Time mode.)

If your battery seems to last less time than expected, condition the battery. To do this, turn it to Talk Mode and let the battery drain for 4 hours. Then place the headset back in the charger for 4 hours. You should only have to do this once.
